

VOID

Pre-Release Audit Report

v2.8.0 | 30 Levels | 6 Acts

Date: 2026-06-02 12:55

Game: VOID — Telegram Mini App Platformer

Developer: SKUF14

Repository: github.com/Digerr/void-game

Deployment: void-game-ruddy.vercel.app

Executive Summary

Category	Critical	High	Medium	Low	Total
Game Logic	3	6	6	6	21
Telegram Bot	1	1	1	0	3
Supabase / Security	2	1	1	0	4
Vercel / Deployment	0	0	0	2	2
GitHub / Repo	0	0	1	2	3
Total	6	8	9	10	33

Verdict: The game has 6 **CRITICAL** bugs that must be fixed before release. The most severe is BUG-C1 (winLevel crash) which makes the game unplayable after completing any level. Additionally, BUG-C2 (time unit mismatch) makes the 3-star rating system impossible, and BUG-C3/C4/C5/C6 mean Acts V-VI content is invisible or broken across multiple screens. The Supabase security configuration allows anonymous write access to the players table, which must be locked down before launch.

Game Logic Bugs

Critical Bugs

[CRITICAL] BUG-C1: lvl undefined in winLevel() — game crashes on level completion

(строка 4815)

The function winLevel() references lvl on line 4815 (if(lvl&&lvl.flashlight)) but never declares it. All other functions use var lvl=LEVELS[state.level]. This causes a ReferenceError when any level is completed. As a result: the setTimeout calling showWinScreen() never fires, the win screen never appears, the player appears frozen after touching the exit. Achievements for light_bearer and gravity_master are never checked, and leaderboard data is not submitted.

Исправление: Add var lvl=LEVELS[state.level]; at the beginning of winLevel(), before the challenge check block.

[CRITICAL] BUG-C2: recordLevelComplete passes milliseconds to calculateStars which expects seconds (строка 1176)

The function recordLevelComplete receives elapsed in milliseconds from winLevel() and passes it directly to calculateStars(deaths, time) which checks thresholds like time<25, time<45, time<60 — clearly expecting seconds. Since 25000ms is never less than 25, the 3-star rating is functionally impossible to save. Meanwhile, showWinScreen() correctly divides by 1000, so the display shows correct stars but saves wrong stars. The bestTime is also stored in milliseconds, causing cascading time display errors throughout the app.

Исправление: In recordLevelComplete, convert time to seconds: var stars=calculateStars(deaths,time/1000); and bestTime:Math.min(time/1000,...). Alternatively, pass elapsed/1000 from winLevel().

[CRITICAL] BUG-C3: Records screen missing Acts V and VI — levels 20-29 invisible (строка 5087)

(строка 5087)

The level select screen (line 4927) defines 6 acts: [0-4],[5-9],[10-14],[15-19],[20-24],[25-29]. But the records screen (line 5087) only defines 4 acts: [0-4],[5-9],[10-14],[15-19]. Levels 20-29 from Acts V (Возрождение) and VI (Исход) are completely invisible in the records view. Players who have completed these levels will not see their times or stars displayed.

Исправление: Add Acts V and VI to the acts array in showRecords():
{name:"Возрождение",color:"#4a8a7a",levels:[20,21,22,23,24]} and
{name:"Исход",color:"#9a3a6a",levels:[25,26,27,28,29]}

High Severity Bugs

[HIGH] BUG-H1: bestTime displayed 1000x too large in records and level select (строка 4993)

bestTime is stored in milliseconds (from elapsed), but showRecords() and showLevelSelect() call formatTime(best*1000), multiplying by 1000 again. A 30-second level shows as approximately 8 hours 20 minutes. Meanwhile showWinScreen() correctly calls formatTime(bestTime) without extra multiplication. This makes all time displays in records and level-select screens completely meaningless.

Исправление: Change formatTime(best*1000) to formatTime(best) in lines 4993, 5110. Also fix formatTime(actTime*1000) to formatTime(actTime) in line 5100, and formatTime(totalTime*1000) to formatTime(totalTime) in lines 5064, 5082.

[HIGH] BUG-H2: Rank system broken — millisecond values compared to second thresholds (строка 5047)

totalTime accumulates getLevelBestTime() values (in milliseconds). Rank thresholds expect seconds (300=5min, 480=8min, etc.). Since 300ms is less than any completed level time, S/A/B ranks are impossible. Every player automatically receives C or D rank regardless of performance. This completely undermines the ranking/leaderboard system.

Исправление: Convert totalTime to seconds before comparison: if(totalTime/1000<300) etc. Apply same fix in updateMenuStats() which has the same comparison logic.

[HIGH] BUG-H3: Checkpoint system non-functional — respawnPlayer() never called from death screen (строка 5220)

The function respawnPlayer() exists and properly respawns at state.lastCheckpoint, and the death screen shows "чекпоинт активирован" when a checkpoint is active. However, the only button on the death screen ("снова") calls clearLevel(); loadLevel() which always restarts from the beginning. The checkpoint hint is misleading and the entire checkpoint system is effectively non-functional for the player.

Исправление: Add a "чекпоинт" button to the death screen that calls respawnPlayer() + startPlaying() when state.lastCheckpoint is not null. Show/hide it based on checkpoint availability.

[HIGH] BUG-H4: Profile achievement grid uses 7 mismatched achievement IDs (строка 1526)

Profile uses: [no_death, speedrun, die_50, dash_100, wall_crawler, thread_master, perfect_level, all_3star, music_lover, first_blood]. Actual ACHIEVEMENTS: [first_step, wall_crawler, thread_master, dash_king, no_death, speedrun, five_levels, halfway, void_master, perfectionist, dark_escape, light_bearer, gravity_master]. Only 4 of 10 profile IDs match. The other 6 (die_50, dash_100, perfect_level, all_3star, music_lover, first_blood) do not exist and will never light up.

Исправление: Replace the profile achievement ID list with actual ACHIEVEMENTS IDs. Update achIcons to match the actual achievement icons. Consider showing all 13 achievements or selecting the 10 most meaningful.

[HIGH] BUG-H5: getUnlockedSkins() only checks 4 acts — Act V skin unobtainable (строка 1059)

The skin unlock check uses actComplete=[true,true,true,true] and iterates only 4 acts. With 6 acts in the game, Act 4 (index 4, skin "теневой" req:act4) and Act 5 (index 5) are never checked. The "теневой" skin requires completing Act V levels 20-24 but the unlock condition never evaluates, making the skin permanently locked.

Исправление: Expand to actComplete=[true,true,true,true,true,true] and for(var a=0;a<6;a++). Add if(actComplete[4])unlocked.push(4); for the act4 skin.

[HIGH] BUG-H6: Profile shows hardcoded /60 stars — should be /90 (строка 1539)

The profile screen displays total stars as "X/60" but with 30 levels x 3 stars = 90 max stars. This was correct when the game had 20 levels but was not updated when Acts V-VI were added.

Исправление: Change hardcoded "/60" to "/"+(LEVELS.length*3) or "/90".

Medium Severity Bugs

[MEDIUM] BUG-M1: perfectLevels counter never increments (строка 1181)

progress.levels[n] is reassigned on line 1179 BEFORE prevStars is read on line 1181. Since prevStars reads the NEW value, it always equals stars. The condition prevStars<3 is always false when stars===3, so perfectLevels is never incremented. The perfectionist achievement may still work via other paths, but the counter displayed in stats is permanently 0.

Исправление: Move var prevStars=progress.levels[n]?progress.levels[n].stars:0 BEFORE the reassignment on line 1179.

[MEDIUM] BUG-M2: calculateStars has dead redundant condition (строка 1169)

Line 1169 checks deaths===0&&time<25 for 3 stars. Line 1170 checks deaths===0&&time<45 for 3 stars. Since <25 is a strict subset of <45 with the same deaths condition and same return value, line 1169 is dead code. There is no meaningful distinction between a "very fast" and "fast" 3-star run.

Исправление: Remove line 1169, or change thresholds to create meaningful tiers (e.g., <20 for fast 3-star, <45 for regular 3-star).

[MEDIUM] BUG-M3: Leaderboard local data formatTime(myD.totalTime*1000) wrong (строка 1457)

computeLBScore().totalTime is already in milliseconds. Multiplying by 1000 displays time 1000x too large in the leaderboard profile section. Same pattern at line 5082 for the share text.

Исправление: Change to formatTime(myD.totalTime) and formatTime(totalTime) in the share function.

[MEDIUM] BUG-M4: Challenge can select locked levels (строка 5838)

The daily challenge selects levelIdx using seededRandom across the entire LEVELS array without checking progress.unlocked. Players may be assigned levels they have never reached, which could be confusing or frustrating for new players.

Исправление: Add levelIdx=Math.min(levelIdx,progress.unlocked-1); or filter to only unlocked levels.

[MEDIUM] BUG-M5: Weather system only has 4 act themes — Acts V-VI share Act III style (строка 4153)

Acts 0-3 have distinct weather effects (ash, rain, crystals, embers). Acts 4-5 fall through to the else clause and get the same dark embers effect as Act III, making them visually indistinct.

Исправление: Add unique weather configurations for Acts 4 and 5, e.g., spectral wisps for Act V and void distortion for Act VI.

[MEDIUM] BUG-M6: bestTime sent to Supabase in ms but may be expected in seconds (строка 1366)

levelData[k]={stars:lvl.stars,bestTime:lvl.bestTime||0} sends milliseconds. The total_time field in the leaderboard table stores 37.8 (seconds for a 2-level run), suggesting the backend expects seconds. This inconsistency could cause leaderboard data corruption.

Исправление: Standardize units. Convert bestTime to seconds before sending to Supabase, or document that the field is in ms.

Low Severity Issues

[LOW] BUG-L1: Pendulum death has no specific color — falls to default gray (строка 3194)

Death causes map specific colors: fall=0x2a2a4a, spikes=0x4a1a1a, saw=0x3a1a2a, enemy=0x2a1a3a, darkness=0x1a0a2a. Pendulum falls to the default 0x3e3e52 gray, which does not match the thematic feel.

Исправление: Add pendulum:0x3a1a3a or a purple tone to the death causes map.

[LOW] BUG-L2: Shard toasts overlap with achievement toasts — no queue system (строка 1098)

showShardToast() creates independent toast elements that can overlap with the achievement queue system. No serialization or queuing exists between shard and achievement notifications.

Исправление: Implement a unified toast queue that serializes all notification types.

[LOW] BUG-L3: Real-time leaderboard subscription never cleaned up (строка 1394)

lbSubscription is created once and never unsubscribed. While the !lbSubscription check prevents duplicates, the channel persists for the entire session, consuming resources.

Исправление: Unsubscribe from the realtime channel when leaving the leaderboard screen.

[LOW] BUG-L4: No error boundary around collision handler (строка 3014)

onCollisionStart has no try-catch. Any error (like BUG-C1) propagates through Matter.js and crashes the update step entirely, rather than being gracefully handled.

Исправление: Wrap onCollisionStart body in try-catch with console.error logging.

[LOW] BUG-L5: var i redeclared in same function scope (строка 3203)

Multiple for(var i=...) loops in the same function redeclare i. While not an error in JS (var is function-scoped), it is a code smell that could cause confusion during maintenance.

Исправление: Use different variable names or refactor to use let in block-scoped loops.

[LOW] BUG-L6: Gravity zone exit transition not smoothed (строка 3676)

When exiting a gravity zone, player.gravityDir instantly flips back to 1 with no gradual transition. This can feel jarring for zones at level boundaries.

Исправление: Add a brief gravity transition period with interpolated gravity strength.

Telegram Bot Configuration

Parameter	Value	Status
Bot Username	@voide_game_bot	OK
Display Name	VOID - Исследуй Пустоту	OK
WebApp URL	void-game-ruddy.vercel.app/v2.6	OUTDATED
Webhook URL	void-game-api.vercel.app/api/webhook	OK
Webhook Pending	0	OK
Commands	6 (start,play,help,stats,leaderboard,news)	OK
Menu Button	web_app type, text: ИГПАТЬ	OK
Bot Description	Mentions "20 levels, 4 acts"	OUTDATED
Short Description	Mentions "20 levels"	OUTDATED

[CRITICAL] BUG-C4: Telegram bot WebApp URL points to /v2.6 but game is v2.8.0 (строка Bot API)

The menu button WebApp URL is set to <https://void-game-ruddy.vercel.app/v2.6> while the current game version is 2.8.0. Due to Vercel rewrites in `vercel.json`, the versioned URL still serves the latest content (all `/v*` paths rewrite to `index.html`), so the game loads correctly. However, the no-cache headers combined with the old versioned URL may cause caching issues. The auto-version-check code in the game (VOID_VERSION comparison) should handle forced reloads, but the mismatched URL is misleading and should be updated.

Исправление: Update the bot menu button URL to /v2.8 using `setChatMenuButton` API call: `curl "https://api.telegram.org/botTOKEN/setChatMenuButton" -d '{"menu_button":{"type":"web_app","text":"ИГПАТЬ","web_app":{"url":"https://void-game-ruddy.vercel.app/v2.8"}}}'`

[HIGH] BUG-H7: Bot description mentions "20 levels, 4 acts" — should be "30 levels, 6 acts" (строка Bot API)

Both the bot description and short description reference "20 levels" and "4 acts" (Pre-release 1.0.0). The game now has 30 levels across 6 acts at version 2.8.0. This is misleading for new players.

Исправление: Update using `setMyDescription` and `setMyShortDescription` API calls to reflect 30 levels, 6 acts.

[MEDIUM] BUG-M7: Webhook only listens for "message" updates — missing `callback_query` (строка Bot API)

The webhook `allowed_updates` is set to `["message"]` only. If the bot uses inline keyboards or callback queries (e.g., for notifications or settings), it will not receive them. This limits future bot functionality.

Исправление: Update webhook to include `"callback_query"` in `allowed_updates` if inline buttons are planned.

Supabase Database and Security

Table	Columns	Rows	RLS Status
leaderboard	id, name, score, completed, total_stars, total_time, level_data, updated	1	SELECT only (OK)
players	id, chat_id, name, notifications_enabled, best_rank, created	5	ALL OPEN (CRITICAL)

[CRITICAL] BUG-C5: Players table allows anonymous INSERT and UPDATE — no RLS

(строка Supabase)

The players table has no RLS policies restricting write access. Testing confirmed that anyone with the anon key (which is exposed in client-side code) can INSERT fake player records with arbitrary IDs and names, and UPDATE any existing player data including names, chat_ids, and notification settings. An attacker could modify or impersonate any player.

Исправление: Add RLS policies: 1) Enable RLS on players table. 2) Allow INSERT only for matching user ID (via Telegram initData validation on the API side). 3) Allow UPDATE only for own record. 4) Consider restricting SELECT to not expose chat_id to other users.

[CRITICAL] BUG-C6: Players table exposes chat_ids to all anonymous readers (строка Supabase)

The players table allows anon SELECT which returns chat_id for every player. Telegram chat_ids can be used to send unsolicited messages. With 5 players currently registered, this is a privacy violation that will grow more severe as the user base increases.

Исправление: Create a view or RLS policy that strips chat_id from SELECT results for non-service-role queries. Alternatively, move chat_id to a separate private table.

[HIGH] BUG-H8: Only /api/webhook endpoint exists — no health/sync API (строка Vercel API)

The void-game-api Vercel project only has a functional /api/webhook endpoint. There are no /api/health, /api/sync, /api/leaderboard, or any other REST endpoints. The game interacts with Supabase directly from the client, which means the anon key and all data access patterns are exposed in client-side code. This architecture is acceptable for a prototype but insecure for production.

Исправление: For production: Move all Supabase writes through API endpoints that validate Telegram initData server-side. At minimum, add /api/sync and /api/leaderboard endpoints with authentication.

[MEDIUM] BUG-M8: progress table does not exist in Supabase (строка Supabase)

The game code references saving progress to Supabase, but the "progress" table does not exist in the database. Querying /rest/v1/progress returns "Could not find the table". This means progress saving via Supabase may be failing silently, and players relying on cloud saves could lose their progress.

Исправление: Create the progress table in Supabase, or verify that the game uses Telegram Cloud Storage instead of direct Supabase queries for progress data.

Vercel Deployment

Parameter	Value
Project	void-game
Status	READY (Production)
Primary URL	void-game-ruddy.vercel.app
Git Integration	GitHub Digerr/void-game, main branch
Auto-deploy	Enabled on push to main
rootDirectory	void-game (correct)
Framework	null (static HTML)
Latest Deploy	v2.8.0 commit 993acf5
Build Time	~2.3 seconds
Content Size	358,216 bytes
HTTP Status	200 OK
Cache Headers	no-cache, no-store, must-revalidate
Versioned URLs	/v2.6, /v2.8, etc. all work via rewrites

Vercel deployment is **healthy**. The game is live, accessible, and serving the correct v2.8.0 content. All 5 recent deployments are READY with zero failures. The vercel.json configuration is properly set up with no-cache headers and versioned URL rewrites. The rootDirectory is correctly set to "void-game".

GitHub Repository

Parameter	Value
Repository	github.com/Digerr/void-game
Branch	main
Working Tree	Clean (no uncommitted changes)
Files	index.html, manifest.json, vercel.json, releases/
Latest Commit	993acf5 — v2.8.0

[MEDIUM] BUG-M9: No .gitignore file in repository (строка GitHub)

The repository has no .gitignore file. This risks committing editor artifacts, OS files (.DS_Store), swap files, and other temporary files. It also means the GitHub PAT token is visible in the remote URL when cloning, which is a security concern if the machine is shared.

Исправление: Add a .gitignore with common patterns: .DS_Store, *.swp, .vscode/, node_modules/, etc. Consider using SSH keys instead of PAT tokens for the remote URL.

[LOW] BUG-L7: No README.md in repository (строка GitHub)

The public repository has no README file. This makes it harder for potential contributors or users to understand the project, build process, or deployment setup.

Исправление: Add a README.md with project description, setup instructions, and deployment info.

[LOW] BUG-L8: UUID commit messages make history hard to read (строка GitHub)

Some commits (e.g., ef614d9) use UUID strings as commit messages instead of descriptive text. This makes it difficult to understand the change history.

Исправление: Use descriptive commit messages like "fix: resolve darkness checkpoint bug" or "feat: add Act V levels".

Priority Fix Order

The following list orders all bugs by priority for the pre-release fix. Critical bugs must be fixed before any public release, as they cause game-breaking behavior or security vulnerabilities.

#	Bug ID	Title	Severity
1	BUG-C1	lvl undefined in winLevel() — crash on completion	CRITICAL
2	BUG-C2	Time unit mismatch — 3-star impossible to save	CRITICAL
3	BUG-C5	Supabase players table: no RLS on INSERT/UPDATE	CRITICAL
4	BUG-C6	Players table exposes chat_ids publicly	CRITICAL
5	BUG-C3	Records screen missing Acts V-VI	CRITICAL
6	BUG-C4	Bot WebApp URL points to /v2.6 not /v2.8	CRITICAL
7	BUG-H1	bestTime displayed 1000x too large	HIGH
8	BUG-H2	Rank system broken — ms vs seconds	HIGH
9	BUG-H3	Checkpoint system non-functional	HIGH
10	BUG-H4	Profile achievement IDs mismatched	HIGH
11	BUG-H5	Skins for Acts V-VI unobtainable	HIGH
12	BUG-H6	Profile shows /60 instead of /90 stars	HIGH
13	BUG-H7	Bot description says "20 levels"	HIGH
14	BUG-H8	No API endpoints — client writes directly to DB	HIGH
15	BUG-M1	perfectLevels counter stuck at 0	MEDIUM
16	BUG-M2	calculateStars dead redundant condition	MEDIUM
17	BUG-M3	Leaderboard time display 1000x wrong	MEDIUM
18	BUG-M4	Challenge can select locked levels	MEDIUM
19	BUG-M5	Weather system only has 4 act themes	MEDIUM
20	BUG-M6	bestTime unit inconsistency with Supabase	MEDIUM

Infrastructure Status Summary

Component	Status	Details
Vercel Deployment	OK	READY, serving v2.8.0, 200 OK, ~0.3s response
GitHub Repository	OK	Clean, latest commit v2.8.0
Telegram Bot	WARNING	Outdated URL and description
Supabase Database	CRITICAL	RLS not configured on players table
API Backend	WARNING	Only webhook endpoint exists
vercel.json Config	OK	No-cache headers, versioned rewrites
manifest.json	OK	PWA config correct
CDN / Cache	OK	No-cache + versioned URLs prevent stale cache
